

Google glass (stylized simply as GLASS) is an augmented reality head-mounted display being developed by Google in the project glass research and development project. Google glass displays information in a smartphone-like format hands-free, and can interact with the Internet via natural language voice commands.

GLASS

Google started Project Glass to build technology that's seamless, beautiful and empowering. To share the world through your eyes. To get answers and updates, instantly. To be there when you need it, and out of your way when you don't.

They're inviting a small group of Explorers to help them discover the full potential of Glass. Follow them on their journey, and help them shape the future.

What it does

You have to only say “take a picture” to take a picture and speak to send a message. If you have some Google glass you can record what you see.

Hands-free and ask whatever’s on your mind.

It translates your voice and answers without having to ask too.
