[Index laws](#)

#### Index laws

The following index laws have been established, where  $a$  and  $b$  are integers and  $m$  and  $n$  are non-zero whole numbers.

- To multiply powers with the same base, add the indices.

$$a^m \times a^n = a^{m+n}$$

- To divide powers with the same base, subtract the indices.

$$\frac{a^m}{a^n} = a^{m-n}, \text{ provided } m > n \text{ and } a \neq 0$$

- To raise a power to a power, multiply the indices.

$$(a^m)^n = a^{mn}$$

- A power of a product is the product of the powers.

$$(ab)^m = a^m b^m$$

- A power of a quotient is the quotient of the powers.

$$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m} = a^{m-n}, \text{ provided } b \neq 0$$

These laws also hold when  $a$  and  $b$  are real.

#### Example 2

Write  $5^3 \times 5^6$  as a single power of 5.

#### Solution

$$\begin{aligned} 5^3 \times 5^6 &= 5^{3+6} \\ &= 5^9 \end{aligned}$$

#### Example 3

Simplify  $\frac{3^5}{3^2}$

#### Solution

$$\begin{aligned} \frac{3^5}{3^2} &= 3^{5-2} \\ &= 3^3 \\ &= 27 \end{aligned}$$

#### Example 4

Simplify  $\left(\frac{x^3}{y^2}\right)^2 \times \left(\frac{y}{x}\right)^4$

#### Solution

$$\begin{aligned} \left(\frac{x^3}{y^2}\right)^2 \times \left(\frac{y}{x}\right)^4 &= \frac{x^6}{y^4} \times \frac{y^4}{x^4} \\ &= x^2 \end{aligned}$$
